Lumara Communications Security

Secure-ISS is proud to announce our newest product in email security, which supersedes our previous offering.

The new platform, leveraging Checkpoint's Harmony Email Security & Communications offering, delivers an expanded range of features that were not possible with the previous solution, including much closer integration with online platforms such as Microsoft 365.

Here's what you can expect when making the switch:

A Cleaner Inbox

With enhanced detection engines — including per-user sender reputational history and AI-powered language models for deeper content analysis — we can now provide far more accurate detection of phishing attempts, malicious content, and other suspicious activity.

Impersonation Protection

Safeguards against lookalike domains and display name spoofing, preventing attackers from pretending to be trusted colleagues or partners.

Flexible User Coverage

By popular demand, we can now offer protection licences for a selected group of users, rather than the traditional “all or nothing” protection model.

Stronger Reporting Features

Manager approval workflows are now available. Reporting has also been enhanced, with options for weekly, daily, or even multi-day reports on blocked emails. Users can also be granted self-service access to manage their own quarantined emails where required.

Link Scanning

All internet-facing links within emails are rewritten and scanned at the time of click. If malicious activity is detected, the user is immediately redirected to safety.

Smart Banners

Smarter warnings — Gain confidence with contextual banners that clearly highlight targeted risks.

Compromised Account Detection

Instantly detect when a user account has been compromised through malicious activity, with the option to automatically lock the account upon detection.

Shadow IT Visibility

Identify which third-party services your employees are using, and check for breaches of company policy. For example, if company policy mandates OneDrive for storage, you can quickly identify users relying on Dropbox or other cloud providers.

Work Alongside Built-In Protection

Harmony Email Security does not disable native protections — instead, it complements them to provide true multi-layered security.

No More Mail Delays

With the legacy model, mail was routed through another system first, which sometimes caused delivery delays in email services. Harmony integrates directly with Microsoft 365, so emails should arrive faster and more reliably.

Email Forensics

Gain full post-delivery forensics and email analysis, including sender reputation, link sandboxing, scoring, and detailed weighting for risk assessment.

Invisible Security

Unlike legacy systems, Harmony operates with an invisible protection layer — attackers cannot see or probe it, making it harder for them to bypass.

Like-for-Like Feature Coverage

All the core protections from the Kaspersky Email Security platform are still covered (and even improved on), including:

- Phishing Detection
- Malware Detection
- Unwanted Email Filtering
- Attachment Scanning – now with support for encrypted file scanning
- Sender Allowlisting & Blocklisting
- DMARC, SPF, and DKIM enforcement
